BACKGROUND

Description

CACYBP (Calcyclin-binding protein) is primarily a nuclear protein that contains one CS domain and one SGS domain. CACYBP is believed to be involved in calcium-dependent ubiquitination and subsequent proteosomal degradation of target proteins. It most likely serves as a molecular bridge in ubiquitin E3 complexes. It also participates in the ubiquitin-mediated degradation of b-catenin. CACYBP is thought to be a potential inhibitor of cell growth and invasion in the gastric cancer cell through its effects on b-catenin protein expression and transcriptional activation of TCF/LEF.

DATA

Western blot analysis (WB)

The cell lysates of HeLa, 293T, Jurkat and A549(40ug) were resolved by SDS-PAGE, transferred to PVDF membrane and probed with anti-human CACYBP antibody (1:1000). Proteins were visualized using a goat anti-mouse secondary antibody conjugated to HRP and an ECL detection system.

Immunocytochemistry/Immunofluorescence (ICC/IF)

ICC/IF analysis of CACYBP in PC3 cells line, stained with DAPI (Blue) for nucleus staining and monoclonal anti-human CACYBP antibody (1:100) with goat anti-mouse IgG-Alexa fluor 488 conjugate (Green).
