BACKGROUND

Description

SuMF1 (Sulfatase-modifying factor 1) belongs to the SuMF family. SuMF1 is an enzyme that catalyzes the hydrolysis of sulfate esters by oxidizing a cysteine residue in the substrate sulfatase to an active site 3-oxoalanine residue, which is also known as C-alpha-formylglycine. Mutations in this gene cause multiple sulfatase deficiency, a lysosomal storage disorder. Recombinant human SuMF1 protein, fused to His-tag at N-terminus, was expressed in E. coli.
